Implementation of MINIMAX Algorithm

```
def minimax(node, depth, is_max, alpha=float("-inf"), beta=float("inf")):
    """node is either a number (leaf) or a list of child nodes. Alpha-beta included."""
    if not isinstance(node, list):
        return node
    if is_max:
        best = float("-inf")
        for child in node:
            best = max(best, minimax(child, depth + 1, False, alpha, beta))
            alpha = max(alpha, best)
            if beta <= alpha:
                break
        return best
    best = float("inf")
    for child in node:
        best = min(best, minimax(child, depth + 1, True, alpha, beta))
        beta = min(beta, best)
        if beta <= alpha:
            break
    return best

def program3():
    print("\n=== 3. MINIMAX (with alpha-beta pruning) ===")
    tree = [[[3, 5], [6, 9]], [[1, 2], [0, -1]]]
    print("Game tree:", tree)
    print("Optimal value for MAX at root:", minimax(tree, 0, True))

if __name__ == "__main__":
    program3()
```
